

Brave - Project Documentation

A minimalist 2D survival game built with Unity.

Game Description

Brave is a challenging 2D top-down game where players test their reflexes and spatial awareness. You play as the **Red Square**, trapped in a lethal obstacle course. Your mission is to navigate the map, dodge enemies, and secure the key to escape.

Core Mechanics

- **Movement:** Grid-based or free-form movement (WASD/Arrows).
- **The Hunter (Pink Circles):** These enemies track the player's position and follow you continuously.
- **The Patroller (Blue Squares):** Some blue squares move vertically (Up/Down) at set intervals to block your path.
- **The Spinner (Grey Rectangle):** A central obstacle moving in a constant circular motion.
- **The Objective:** Collect the **Yellow Key** and reach the **Green Square**.

Controls

- **W / Up** : Move Up
- **A / Left** : Move Left
- **S / Down** : Move Down
- **D / Right** : Move Right

Technical Details

This project demonstrates key game development concepts including:

- **Object Rotation:** Applied to the grey rectangle obstacle.
- **Oscillating Movement:** Sine-wave or Lerp-based movement for the blue blocks.
- **Simple AI:** Vector subtraction and normalization to create "follow" logic for pink enemies.
- **Collision Detection:** Trigger-based events for the key and win-condition.
